

BTC Dashboard Merge and Wireframe Review

Sep 26, 2026 · @Riyad Kalla

Yes, anchor on it. The merge is faithful to the review and better in several places, and the wireframe's structure is sound. Before implementation, seven rule gaps need closing, because code cannot guess them. Nine wireframe fixes can be folded into design; none of them changes the architecture.

Replaying the rules the merge had to invent was mostly good news. The 12-month pause got more coins after 7 of 8 sell-roll fires, and All in beat spreading the same cash in 4 of 4.

Where the merge improved on my proposal

The merge adopted the substance and pushed back in the right places. I would keep all of these as written.

- **It declined to invent a power-law floor band.** I suggested one as an Exit monitor without defining it. Refusing an undefined band is correct.
- **It kept the original buy-cross table** and filed my +125/+57/+269/+153 as end-date sensitive. The record stays the study's record.
- **It left tax jurisdiction out of the spec.** A tax line without a hard-coded rate keeps the spec portable.
- **"Narrowed on purpose" is honest bookkeeping.** It says openly that the -20% and +55% lines now choose lump versus spread, which A5 once forbade, and names the new authority.
- **It froze the four-Friday spell count before any replay.** That is the right order, even though the replay below shows the number sits on a boundary.
- **The corrected audit count adds up:** Pass 11, Fail 6, Extension 6, Conflict 4, Refused 1, which is 28 checks.

What a replay of the new rules says

The merge added rules no one had tested. I replayed them on the same Coin Metrics history, scoring coins against steady weekly buying, which is the goal's own yardstick.

Rule	Replay result	What it means for the spec
12-month Stand down	Paused cash, released when Build or All in turned on or at 12 months, got more coins than weekly buying after 7 of 8 fires (+10% to +90%). June 2013 got 67% fewer.	Supports the pause. Record: 7 of 8, floor 59%, with the one large loss named. Fires in 2014 and 2018 overlap, so treat it as about six episodes.
Ending the pause at the -20% line instead	Would have ended the 2014 and 2022 pauses earlier. The 2022 gain falls from +90% to +43% of coins.	Keep Build and All in as the only early exits, and write that precedence down.
All in at the fire	Beat a 26-week spread in 4 of 4 fires (+2% to +60% coins) and a 52-week spread in 4 of 4 (+18% to +92%).	This is the goal's score. Put it on the record line.
Lump in, by independent regime	Won 6 of 6 finished regimes, floor 69%. One regime has been open since November 2025.	Replace "93% of overlapping weeks" with 6 of 6, floor 69%.
Slow in, by independent regime	Won 2 of 3 regimes, floor 25%. It lost in 2013-14.	Replace "65%, 85% since 2018" with 2 of 3, floor 25%. It is the weakest record on the page.
Four-Friday spell end	In 2022, exactly four Fridays at or above cost (22 July to 12 August) separated the two spells.	The frozen constant sits on the only historical boundary case. Define it precisely (below).

The weekly percentages in the wireframe (93%, 85%) would sit beside All in's 60% floor and read as higher confidence. By regime, all three use the same contract: episodes, wins, floor.

Seven rule gaps to close before implementation

These are places where the spec leaves a choice that code would have to make silently. Each needs one sentence in 2-signal-strategy.md.

1. **Write the precedence order.** Proposed: All in, then Build, then Stand down, then Lump in or Slow in, then Stay the course. Price crossed the -20% line during the pause after five of eight fires (2014 twice, 2018 twice, 2022), and the replay favors letting the pause run. The wireframe's "Build during stand down" row contradicts the merge, which says Build ends the pause. Delete that row, or say the standing contribution resumes.
2. **Say what happens to paused cash at 12 months.** The merge covers early exits only. Proposed: it becomes extra cash that Friday and follows the gap switch.
3. **Pin the four-Friday boundary.** 2022 had exactly four Fridays at or above cost between spells. "Four or more ends the spell" splits that bear; "more than four" does not. Also define "a leftover carries" as one tranche until it is spent, with a new tranche funded only after that. "Inside a choppy bear" cannot be computed, so drop it.
4. **Give Trim the inputs it needs.** A Bitcoin share needs coins held and a denominator (investable net worth), and Settings has neither, so Trim can never turn on. Trimming only to the ceiling also re-triggers on every small rise. Use a target plus a ceiling, and define "Trim sped up."
5. **Make Exit reachable, or remove it from the state table.** Exit has no trigger, and the page allows no override, so it can never display. Proposed: one dated holder declaration in Settings, "Thesis broken," with the monitors in region 7 as its evidence.
6. **Define the gold flag.** Proposed: at the arm Friday, split the z-score's distance from its 52-week mean into Bitcoin and gold contributions, and flag when gold's share passes a frozen cut. My 38% was a year-over-year figure, not an arm-date split, so it should not be the flag's definition.
7. **Name live data sources and the clock.** The Coin Metrics file I pulled today ends 23 May 2026, so the study's named source is not live. Choose feeds for the daily close, realized cap and gold (with a futures roll rule), and define "Friday close" as a timestamp, such as 00:00 UTC Saturday. Then rebuild the five fire dates on those feeds before go-live, since the strategy already warns that a different print moves the fires.

Wireframe corrections to fold into design

The structure holds: two clocks, one record line, no meters, and collapse rules per region. These fixes are wording and content, not layout.

Where	Now	Change to
Record line, every posture	All in shows a hit rate; Lump in and Slow in show weekly percentages (93%, 65%, 85%)	One contract: wins of episodes, then the floor. Add All in's payoff on the same line: "Beat spreading the same cash over a year, 4 of 4, +18% to +92% coins."
Settings	"Cash on hand for All in"	"Cash available to invest," used by All in, Lump in and Slow in. A pile named for All in invites the reserve back.
Region 1	"At the next chance in this window" and "After that close, unspent cash stays"	"Buy now, or by the 2 Oct close." Then "After that close, the call is whatever that Friday says." At today's -41% gap that is Lump in, which buys the cash, so "stays" is wrong.
Region 6	A sell-roll row but no buy-cross row, and z-score legs with no numbers	Add a buy-cross row: quiet, armed or fired, the date, the z-score against 0, and the gap against -20%. Print the leg values.
Region 6	"Desk print was about +7" and "June low about \$60,000"	Live values. The desk will not exist on a live page. Show price against realized price (about 59% above today) and give the thermometer a scale.
Region 7	Base rate, ceiling state and a 2024 note	Add the thesis monitors the goal puts in this panel, and the caveat: fewer than three independent 5-year windows since 2012, with early growth inflating the rate. Show ETF and treasury numbers, or drop the line.

Where	Now	Change to
Region 5 chart	Schematic places a B above the trend	Buy crosses fire well under the trend. Fix the geometry before a designer copies it, and specify a log price axis.
Region 3	The markdown omits it; the PNG draws a dashed placeholder	Hidden means not rendered.
Not on the wireframe	"No notification setup"	Reconsider. A missed three-Friday window is the page's main failure mode, and one alert on a posture change covers it. It can wait for phase 2.

What to anchor on now, and what gates implementation

Start design now. The region order, the two clocks, the single record line, the collapse rules and the state table are a sound skeleton. The nine wireframe fixes can land during design.

Three tracks can start in parallel with design:

- ☐ **Data pipeline:** live feeds, the Friday-close timestamp, and a rebuild of the five fire dates on those feeds (gap 7).
- ☐ **Chart and context panels:** they depend on data, not on posture rules.
- ☐ **Spec edits:** the seven rule gaps, each one sentence in 2-signal-strategy.md.

The posture engine waits for these:

- ☐ **The seven rule gaps,** closed and frozen.
- ☐ **The arm-to-fire test.** It decides the "Stay the course while armed" and "Build while armed" rows, where extra cash waits. It needs the gold series.
- ☐ **The whole-posture backtest** against steady buying, in coins at 1, 2 and 4 years. The pieces now look good one at a time, but nobody has run them together.

One timing note: today's All-in window closes with the 2 October close. The spec work above does not change that call.

Sources and data notes

- **Data:** [Coin Metrics community data](#), daily price and realized-price ratio, July 2010 to 23 May 2026. It is the same file as the first review.
- **Stand-down replay:** each sell-roll fire is taken at the first Friday of its month. Standing contributions of equal size were either bought weekly or held and released as one lump when Build or All in turned on, or after 52 weeks. T-bill interest is ignored, which understates the pause slightly.
- **Regimes:** runs of Fridays past the -20% or $+55\%$ line, merging runs less than 13 weeks apart. A regime counts as a win if its median week favored the rule, in coins over the next 52 weeks.
- **All in:** coins bought on the fire Friday against the same cash spread evenly over the next 26 or 52 Fridays.
- **Floors:** Wilson 90% lower bound, as in the study. No fees, slippage or taxes. Buy-cross dates come from 1-signal-quality.md; the gold z-score was not rebuilt.
