

BTC Friday Audit and Fix Guide

Sep 28, 2026 · @Riyad Kalla

What was audited

This week mostly follows the revision spec. Evidence and Settings still run on the old dark stylesheet at different widths, and Evidence still reads like the engine's notes. This guide is the work order to fix that. It builds on `docs/17-human-first-implementation-plan.md` in `rkalla/btc-insights` and overrides it where it says so.

How it was checked. The live site only serves page shells to outside fetchers; the content is painted by JavaScript. So I cloned `rkalla/btc-insights` at `9f5c200` (Sep 28), confirmed the deployed `this-week.css` matches it, built it, and served it with the repo's own fixtures (the Sep 25 Friday). Every page was rendered in Chromium with phone emulation at 300–600 px wide (touch, 3× pixel ratio), with text at 100%, 115% and 130%, and at 1440 px on desktop.

Page	Path	Stylesheet	Content width	Theme
This week	<code>/</code>	<code>this-week.css</code>	680 px	Light
Evidence	<code>/evidence/</code>	<code>dashboard.css</code>	1440 px grid	Dark
Settings	<code>/settings.html</code>	<code>dashboard.css</code>	760 px	Dark, no site header

What I couldn't check: the real Pixel. I couldn't reproduce the too-wide layout in emulation (see Fix B), so that fix starts with a one-minute measurement on the phone.

Findings

Three of your observations are confirmed and have a clear cause; the Pixel width one needs a measurement from the phone. Four smaller issues turned up on This week.

#	Severity	Page	Finding	Fix
1	High	Evidence, Settings	Both still load the old dark <code>dashboard.css</code> , with monospace all-caps labels. Content widths differ per page: 680 px, a 1440 px grid, and 760 px.	A
2	High	Evidence	The text is still the engine's analyst notes. The main column uses technical terms 85 times (cross 18, roll 11, lump in 6, fire or fired 8, floor 4, arm 4, z-score 4, grace 3, UTC 2, Wilson 2). The glossary sits below the footer, and the old "Use your cash available to invest" line survived.	C
3	High	Settings	No site header. The tab title still reads "Bitcoin dashboard · Settings". Half the relabel is missing: Coins held, Investable net worth, Ceiling share, Every, Account, Not declared. Inputs are monospace.	D
4	Medium	All, on the Pixel	The layout is about 10% too wide in portrait. It doesn't reproduce in Chromium emulation at 300–600 px, even with text at 130%.	B
5	Medium	This week	Bitcoin today labels Friday's close as "Thursday, Sep 24, 5:00 pm". It's off by a day: <code>spotAsOf</code> is <code>2026-09-25T00:00:00Z</code> for the Sep 25 daily close, but a daily close ends at 00:00 UTC the next day.	This week section
6	Low	This week	The price note says "if your share crosses the limit you set". "Crosses" is on the banned list, so the banned-word test isn't reading that sentence.	This week section

#	Severity	Page	Finding	Fix
7	Low	This week	"A cautious reading is about 6 times in 10 or better" appears twice, in Why and in Has this worked before?	This week section

Finding 2 is partly my spec's fault. The revision spec told Evidence to keep the engine's sentences and technical terms, as long as each term was explained. A glossary doesn't make a page readable. Fix C replaces that rule.

Decisions in docs/17 this guide overrides: Evidence stays dark (now light, like every page), and the Evidence wording rule above. Everything else settled on Sep 27 stands: the Buy strongly record wording, no "19 times in 20", take-profit on the latest price, the static painter and the Settings path.

Fix A: one shell, one look, one width

Every page shares the same stylesheet base, header, footer and 680 px column, so moving between pages changes only the content. This reverses the docs/17 decision that Evidence stays dark; record it there as a Sep 28 decision.

1. Split the CSS into a shared base plus one file per page.

File	Holds	Loaded by
<code>src/painter/site.css</code> (new)	Tokens, <code>@font-face</code> for Geist, reset, <code>text-size-adjust</code> , body, header, tabs, gear, footer, <code>.page</code> , <code>.card</code> , h1 / h2, links, focus ring, <code>.sr-only</code> , chips	Every page, first
<code>this-week.css</code>	Only what's unique to This week: verdict, scale, steps, tiles, risk card, price row	<code>/</code> and <code>/this-week/</code>
<code>evidence.css</code> (new, replaces the Evidence half of <code>dashboard.css</code>)	Chart, readings list, record table, the details disclosures, glossary	<code>/evidence/</code>
<code>settings.css</code> (new, replaces the Settings half of <code>dashboard.css</code>)	Fields, inputs, segmented control, switch, radios, actions	Settings

Move the shared rules out of `this-week.css` rather than copying them. Then delete `dashboard.css`, the dark tokens and the three Geist Mono font files.

2. One width everywhere. Add `--page-max: 680px` to `site.css` and use it for `.site-inner`, `.page` and `.foot-inner` on every page. Side padding, the gap between cards and card padding use the This week values: 16/20/20 px under 600 px, and 24/20/28 px from 600 px. The Evidence chart fills the 680 px column; nothing breaks out of it.

3. One page head and footer. Add `pageHead(title, css)` and `siteFooter()` next to `siteHeader()` in `src/painter/site-header.ts`, and use all three on every page. Titles follow one pattern: This week · BTC Friday, Evidence · BTC Friday, Settings · BTC Friday. On Settings, the gear gets `aria-current="page"`. The footer is the same disclaimer and links on every page.

4. One type system. Geist only. No monospace and no letter-spaced all-caps labels anywhere. Region labels become sentence-case `h2` at 20 px. Figures use `font-variant-numeric: tabular-nums` instead of a monospace face.

5. Light chart colours. Every line passes 3:1 against white.

Chart part	Token	Style
Bitcoin price, Friday closes	<code>--ink</code>	1.5 px solid
Long-run trend	<code>--ink-2</code>	1.5 px solid
20% below trend	<code>--buy</code>	1 px dashed
55% above trend	<code>--caution</code>	1 px dashed
Normal range between them	<code>--neutral-tint</code>	Fill
200-week average	<code>--ink-3</code>	1 px dotted
Buy signal markers	<code>--buy</code>	8 px filled dot, white 2 px ring
Caution signal markers	<code>--caution</code>	8 px filled dot, white 2 px ring
Axis labels and grid	<code>--ink-3</code> text at 12 px, <code>--line</code> grid	—

6. Guard it in the build. Extend the checks in `scripts/build.mjs` so the build fails when any page links `dashboard.css`, when any CSS file contains `#0C0F14`, `Geist Mono`, `monospace` or `text-transform:uppercase`, or when a page is missing `site.css`.

Fix B: the page is too wide on the Pixel

Measure on the phone first, then fix the element it names. In emulation, no page overflowed at 300, 320, 340, 360, 384, 390, 412, 432, 448, 480, 512, 540 or 600 px, with text at 100%, 115% or 130%, with data loading slowly or failing, or while loading. So the cause is something only the real phone does, and guessing risks hiding it.

1. Add a layout probe. When the URL has `?debug=layout`, every page shows a small fixed panel with: `innerWidth`, `documentElement.clientWidth`, `scrollWidth`, `visualViewport.width` and `.scale`, `devicePixelRatio`, and the computed `font-size` of a 16 px test span (this exposes Android font scaling). It also outlines in red every element whose right edge passes `clientWidth`, and lists the first five with their class names. The probe ships in the bundle, is off without the parameter, and writes nothing anywhere.

2. Riyadh opens each page on the Pixel with the probe, in portrait, and sends one screenshot per page. That names the element, or shows the viewport is narrower than expected.

3. Fix the named element, then harden. These are the likely suspects, and worth doing anyway:

- **Unbreakable text.** The old letter-spaced monospace labels (for example "NOW · 25 SEP 2026 DAILY CLOSE" and the window captions) grow fastest under Android's font scaling. Fix A removes them.
- **The chart's hidden table** sits in an absolutely positioned box with no positioned ancestor, so it's placed against the whole page. Give the chart figure `position: relative`, and use the shared `.sr-only` class instead of the inline style in `chart.ts`.
- **Media and tables.** Add `svg, img, table { max-width: 100% }` to `site.css`, and give every grid track `minmax(0, 1fr)`.
- **Text scaling.** `dashboard.css` has no `text-size-adjust`, while `this-week.css` does. Put `-webkit-text-size-adjust: 100%; text-size-adjust: 100%` on `html` in `site.css`.
- **Long figures.** Allow `overflow-wrap: anywhere` on price rows and chips, so a long number wraps before it pushes the page.

4. Safety net, last. Only after the named cause is fixed, add `overflow-x: clip` to `html` and `body`. Never use it instead of the fix: it hides overflow without making content fit.

Done when the probe on the Pixel shows `scrollWidth` equal to `clientWidth`, a visual viewport scale of 1, and no red outlines, on all three pages.

Fix C: rewrite Evidence so it reads like an explanation

Evidence should read as the story behind this week's advice, in This week's plain voice. The exact figures stay one tap away. The new rule: every section opens with a plain sentence that answers its heading, and technical terms appear only inside a collapsed **Show the numbers** panel.

Page rules

- 1. Title:** "Why this week says {step}", for example "Why this week says Buy strongly".
Lead: "Here's the reasoning behind this week's advice, in plain words. Tap Show the numbers under any section for the exact figures."
- 2. Every section** is an `h2` phrased as a plain statement or question, then one plain lead sentence, then at most one picture (chart, timeline or table), then `<details>`
`<summary>Show the numbers</summary>` holding the technical text. The engine's current sentences may move into those panels unchanged.
- 3. The banned-word list from This week applies to Evidence too**, everywhere except inside `<details>` and the glossary.
- 4. Dates and times** use This week's style: "Sep 18, 2026" and "Friday, Oct 2, 5:00 pm your time". Never UTC, "print" or "Opened".
- 5. The glossary moves above the footer** and only needs the terms that appear inside the panels.
- 6. Remove** the "Official call" line (use This week's update line), the "Official call" badge, the all-in window bars (replaced by the timeline below), the Trim and Exit chips, and "Selected marker: detail only. The call does not change."

New order, with this week's copy

#	Section heading	Lead and content	Show the numbers holds
1	The short version	Three bullets. "On Sep 18, our strongest buy signal turned on. It had turned on only 4 times before: 2015, 2019, 2020 and 2023." "At Friday's close, Bitcoin was \$84,413, about 41% below its long-run trend of about \$141,000." "All 4 past times, putting money in at once did better than spreading it over the next year."	Nothing
2	Where Bitcoin is now	"The dark line is Bitcoin's price every Friday since 2013. The grey band is its normal range. Bitcoin is now well below it." The chart, with a "Show past signals" toggle in place of Show fires.	"Depending on the start year we fit the trend from, Bitcoin is 29% to 46% below it. That changes the size of the gap, not the advice." The 200-week average note. The signal table.
3	The signal that turned on	A three-step drawn timeline. Nov 21, 2025: set up, as Bitcoin got unusually cheap against gold while far below its trend. Sep 18, 2026: turned on, as Bitcoin's price in gold climbed back to its one-year average. Friday, Oct 2: the last Friday to act. Under it: "About a quarter of the setup came from gold rising rather than Bitcoin falling. The week it turned on, Bitcoin led, rising 10.4%."	Z-score, gold share 24.5% against the 15% cut, the arm date, "From Sep 12, 2025: Bitcoin about -27%, gold about +11%"

#	Section heading	Lead and content	Show the numbers holds
4	What happened the last 4 times	A table, one row per past signal: date, Bitcoin's price that day, one year later, the biggest drop along the way, and at once against spread out. Then: "Four for four is encouraging, but it's only four. A cautious estimate is that it works about 6 times in 10 or better."	Floor about 60% (Wilson 90%), 4 episodes, the payoff range +18% to +92%, "This signal is still open and isn't counted yet."
5	What else we check	Three rows, each with a plain name, a one-word status and one sentence. Caution signal: Off. "It hasn't turned on since 2021. It paid off 7 of 8 times, but stayed off before the 2019-20 and 2025-26 drops." Below what holders paid? No. "Bitcoin is about 59% above what the average holder paid, about \$53,000." Market temperature: slightly warm. "A mix of several readings, shown for context. It doesn't change the advice."	Sell roll quiet, realized price ratio, thermometer +4, "Build is off until a Friday close"
6	Your Bitcoin	"Keep the Bitcoin you own. Taking profits is off because you haven't set a limit in Settings. Selling for good is off because you haven't told us Bitcoin's long-term case is broken." Settings is a link. Each clause changes with Settings.	Nothing

#	Section heading	Lead and content	Show the numbers holds
7	The long view	"People who bought in any week since 2012 and held for 3, 4, 5 or 10 years were up at least 99% of the time. But there are fewer than three separate five-year stretches to learn from, and the early years flatter the numbers. It's context, not this week's advice." Then: "We also watch for things that would break Bitcoin's long-term case: mining power collapsing, its security failing with no fix, or bans across major markets. These are watched, not triggers."	The Regime from 2024 note, monitors, floor band not defined
8	How early each signal was	Collapsed by default. "If you'd bought on each signal and held to that cycle's peak, how much of the rise would you have caught? This is about timing, not odds, and we never sell at the peak." The cycle cards follow, with rows renamed Buy strongly signal, Add each week and Add at once.	The per-row detail lines
9	What the terms mean	The glossary	—

Section 4 needs two new per-signal numbers from the job: the biggest drop within a year, and the at-once-versus-spread result. The prices are already in the cycle data (\$289, \$5,658, \$11,338, \$27,451 and \$80,944). Add these as numbers under **presentation**, and never parse them out of sentences.

Line-by-line replacements for what's there now

Now	Becomes
Official call: Fri 25 Sep 2026 close · Next close Fri 2 Oct · Friday close is 00:00 UTC Saturday · Opened 28 Sep 2026	This week's advice, set Friday, Sep 25. Next update Friday, Oct 2, 5:00 pm your time.
Rule: All in, from the buy cross	Moves to the glossary's rule names
Buy now, or by the Friday 2 Oct 2026 close. Use your cash available to invest.	Deleted. The advice lives on This week; Evidence links back to it.
After that close, the call is whatever that Friday says. Standing contribution continues.	Deleted, for the same reason
4 of 4. Floor about 60% (Wilson 90%). 4 episodes.	Four for four is encouraging, but it's only four. A cautious estimate is that it works about 6 times in 10 or better.
Beat a 52-week spread, 4 of 4, +18% to +92% coins.	All 4 times, putting money in at once beat spreading it over a year, by 18% to 92% more Bitcoin.
This fire is open. Not high confidence.	This signal is still open and isn't counted yet.
Coins already held stay held. / Trim off · ceiling not set / Exit off · thesis not declared	Section 6's sentence
NOW · 25 SEP 2026 DAILY CLOSE / Stale print	At Friday's close (Sep 25). If newer prices haven't arrived: "We haven't had a new price since {day}."
The latest print is from 25 Sep 2026. Levels may be out of date.	We haven't had a new price since Friday, Sep 25.
Fire week: Led by Bitcoin (+10.4% to this close).	The week it turned on, Bitcoin led, rising 10.4%.
Fit range: ... Other start years: -29% to -46%. The arm holds. Not a price target.	Depending on the start year we fit the trend from, Bitcoin is 29% to 46% below it. That changes the size of the gap, not the advice.

Now	Becomes
These blocks are the Friday close. None of them change the call on a later day. A developing z-score does not arm or fire.	These readings come from Friday's close. Nothing during the week changes the advice.
Fired 18 Sep 2026. Open. Z-score crossed above 0.	Turned on Sep 18, 2026, when Bitcoin's price in gold climbed back to its one-year average.
Quiet. Not armed since 2021.	Off. It hasn't come close since 2021.
About 59% above cost. Cost about \$53,000. Build is off until a Friday close.	Bitcoin is about 59% above what the average holder paid, about \$53,000.
about +4. Signed, zero when the inputs disagree. Non-voting.	Slightly warm. A mix of several readings, shown for context. It doesn't change the advice.
This page does not sell there. A higher share is an earlier price. It is not a higher probability. Sell roll is not in this table. It does not sell coins.	This is about timing, not odds, and we never sell at the peak.
2011 and 2013 had no buy-cross fire. They are not scored.	The strongest buy signal didn't turn on in the 2011 or 2013 cycles, so they aren't shown.

Fix D: Settings in the new style and wording

Settings gets the shared shell from Fix A, light fields, and the rest of the relabel. The `settings.html` path and the `btc-insights.settings.v1` storage key stay as they are.

Shell. Use `pageHead("Settings")`, `siteHeader("settings")` and `siteFooter()`.

Remove the "Back to This week" button and the "SETTINGS" label; the header's tabs do that job. The page `h1` is "Settings" at 28 px on phones and 32 px from 600 px, weight 700. Each group is a `.card`.

Fields. 44 px tall, white, with a 1 px `--line-strong` border and a 12 px radius. Focus shows a 2 px `--buy` ring. Text is Geist at 17 px with tabular figures, and placeholders use `--ink-3`. The \$, %, and BTC affixes are `--ink-3`. The Week and Month control becomes two 44 px segments; the selected one is `--ink` on white with a 1.5 px `--ink` border. The switch is `--buy` when on. Save is a full-width `--buy` button on phones; Cancel is a text link.

Labels still to change:

Now	Becomes
Every	How often
Coins held	Bitcoin you own
Investable net worth	All your investments, including Bitcoin
Target share	Target share of your investments
Ceiling share	Upper limit
Not declared (switch state)	Off
Date	The date you decided
Account	Where you hold it

After saving, go to This week, where the amounts show in place. No toast.

This week: three fixes

This week follows the spec and the Sep 27 decisions; only these three need fixing.

1. **The price's day is wrong.** Bitcoin today shows Friday's close as "Thursday, Sep 24, 5:00 pm". The job stamps the Sep 25 daily close as `spotAsOf: 2026-09-25T00:00:00Z`, the start of that day, but a daily close is the price at the end of the day: `2026-09-26T00:00:00Z`. Stamp daily closes at the end of their UTC day in the job, and add a test that the Sep 25 close renders as "Friday, Sep 25, 5:00 pm" in America/Phoenix. Evidence's "Stale print" logic uses the same stamp, so check it too.
2. **"Crosses" slipped past the banned list.** In the price note, change "if your share crosses the limit you set" to "if your share goes over the limit you set". Then find out why the check missed it: the banned-word test must run on the rendered text of the whole page, including the price note and footer, in every state.
3. **One figure, said once.** "A cautious reading is about 6 times in 10 or better" appears in Why and again in Has this worked before? Keep it only in Has this worked before?, and end the Why bullet at "...beat spreading it over the next year."

Acceptance checks for this round

Ship in this order: the This week fixes, then Fix A, then Fix D, then Fix C. Fix B's probe goes in with Fix A, so the Pixel can be measured as soon as it deploys. Add these to

`test/browser.spec.ts`.

- ☐ **Same shell.** At 390 and 1440 px, all three pages have the same body background, header height, `.site-inner` width, `.page` width (no more than 680 px of content plus padding), card radius and computed `font-family`.
- ☐ **No old styles.** No page links `dashboard.css`, and no CSS file contains `#0C0F14`, `Geist Mono`, `monospace` or `text-transform:uppercase`.
- ☐ **No overflow.** With phone emulation (touch, 3×) at 320, 360, 384, 412, 448 and 480 px, and with text scaled to 100%, 115% and 130%, every page has `innerWidth` equal to the viewport, `scrollWidth` equal to `clientWidth`, and no visible element past the right edge.
- ☐ **Pixel.** With `?debug=layout`, the Pixel shows no red outlines, `scrollWidth` equal to `clientWidth` and a scale of 1 on all three pages.
- ☐ **Evidence reads plainly.** Zero banned-word hits in Evidence text outside `<details>` and the glossary. Every `h2` is followed by a plain sentence before any figure. The glossary comes before the footer.
- ☐ **Settings.** The tab title reads Settings · BTC Friday, the site header is present, and all eight new labels show.
- ☐ **Price day.** The Sep 25 close renders as Friday, Sep 25, 5:00 pm in America/Phoenix.
- ☐ **Accessibility.** axe reports 0 violations on all three pages. Every `<details>` is keyboard-operable, and its summary says what it opens.
- ☐ **Newcomer check on Evidence.** Two people who don't invest read the page for a minute, then answer: why does the page say Buy strongly, and what could go wrong? Both answer in their own words without asking what a term means.

Open questions

Each has a default, so the work doesn't wait.

Question	Default
Should the Evidence chart get more room on desktop than the 680 px column?	No. One width everywhere, as you asked. Revisit only if the chart is hard to read.

Question	Default
Should Evidence keep the cycle cards (How early each signal was) at all?	Keep them, collapsed by default
What does the Pixel probe show?	Unknown until you send the screenshots
